5 things to know about Camera Go

Camera Go is built to improve the photography experience on entry-level smartphones and help users take high quality photos quickly. Recently, Night Mode has also been launched to help users take higher quality photos in low-light environments.

1. Built for simplicity

Camera Go has a clean and simple interface for people using smartphones for the first time. The app uses visuals and icons to help users navigate the camera instead of texts.

2. Take high quality photos — fast

The app is fast on entry-level phones and is optimized to take high quality photos quickly. It works with features such as Portrait Mode, which gives photos a professional look by focusing on the subject and blurs its background.

3. No more low storage surprises

Camera Go tracks how much photo and video storage space users have left and helps them clear up space they no longer need.

4. See the world in different languages

Incorporated with in-camera translate through Google's Lens Go, users can point their camera at foreign text and it will translate it to their chosen language.

5. Capture high quality photos in low-light conditions

Night Mode enables users to take higher quality pictures with brighter and more accurate colors even in low light environments like dimly-lit indoor spaces or outdoors at night. For users who enable the feature, Night Mode will automatically capture simultaneous shots and merge them to produce clearer low-light photos.

The new Night Mode: Take brighter and more detailed pictures in low-light environments
